Subject

Normally Pressured Lance natural
 gas field

I am writing in reference to the proposal to expand the Jonas field. We all understand the need to become energy independent, but I wish plans like this took a longer time frame. The expand so much so quickly fits the old model of boom and bust. Can this be done in way that is sustainable economically for the long term? Do so many wells need to be put on line so quickly. I understand the drilling companies like it, but you don't have to travel far in Wyoming to see the sad results of the boom/bust cycle.

I am also very concerned about the air pollution. This development should not endanger the citizens of that area. Somehow the permitting process needs to absolutely guarantee that the present pollution is reduced enough to meet all health standards and that the new drilling will never create a repeat of that pollution. Of course, this concern fits with my first concern. Longer term thinking will help.

Thanks for your consideration.

Sincerely,

Richard Ridgway
